Maximum Marks	6 Marks

Hyperparameter Tuning Documentation:

Hyperparameter tuning involves adjusting the parameters that govern the training process of machine learning models to optimize their performance. It includes methods such as grid search, random search, and Bayesian optimization. Proper documentation helps in understanding the impact of different hyperparameters, streamlining the tuning process, and replicating results. Clear records of hyperparameter settings and their outcomes are essential for achieving the best model accuracy and efficiency.

Model	Tuned Hyperparameters	Optimal Values

Linear Regression

```
from sklearn.linear_model import Ridge
ridge = Ridge()
parameters = ('alpha': [0.1, 1, 10])  # Example values for regularization strength

ridge_regressor = GridSearchCV(ridge, parameters, scoring='neg_mean_squared_error', cv=5)
ridge_regressor.fit(x_train, y_train)

best_alpha = ridge_regressor.best_params_['alpha']
print("Best Alpha:", best_alpha)

# Using the best model found by GridSearchCV
best_ridge = ridge_regressor.best_estimator_
best_ridge.fit(x_train, y_train)
pred_ridge = best_ridge.predict(x_test)
```

```
mae_ridge = mean_absolute_error(y_test, pred_ridge)
mse_ridge = mean_squared_error(y_test, pred_ridge)
rmse_ridge = np.sqrt(mse_ridge)
rsq_ridge = r2_score(y_test, pred_ridge)
print("MAE: %.3f" % mae_ridge)
print("MSE: %.3f" % mse_ridge)
print("RMSE: %.3f" % rmse_ridge)
print("R-Square: %.3f" % rsq_ridge)
print("Training Accuracy:", best_ridge.score(x_train, y_train))
print("Testing Accuracy:", best_ridge.score(x_test, y_test))
Best Alpha: 0.1
MAE: 95.466
MSE: 14043.502
RMSE: 118.505
R-Square: 0.991
Training Accuracy: 0.991011446378135
Testing Accuracy: 0.9913088598782471
```

RandomForest

Regressor

```
param_grid = {
    'n_estimators': [50, 100, 200],
    'max_depth': [None, 10, 20, 30],
